Q ⇒ i/p → | 1 | 2 | 3 | ⇒ ∞ supply of these 3 no.

target = 5 | n distinct ele

Sol ⇒ Min no. of ele required to reach target sum

5 ⇒ {1, 1, 1, 1, 1} → 5 ele

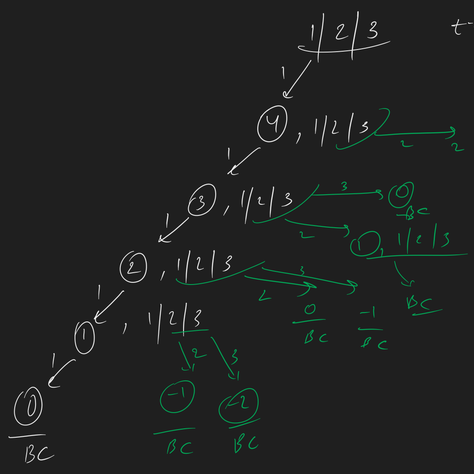
{1, 1, 1, 2} → 4

{2, 3} → 2

{1, 2, 2} → 3

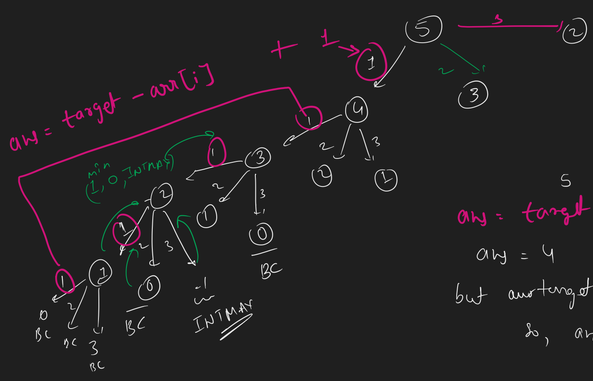
{1, 1, 3} → 3

min = 2 {2, 3}



if we find 0 then this means we reach our target.

[1, 2, 3] targetSum = 5



ans = target − arr[i]

5 − 1

ans = 4

but ans+target sum = 5

so, ans + 1 = 5

Code

```
minNum (arr, targetSum)
{
    if (targetSum == 0) return 0;

    if (targetSum < 0) return INT_MAX;

    int mini = INT_MAX;
    for( int i=0; i<n ; i++)
    {   int ans = minNum(arr, targetSum - arr[i])
        if (ans != INT_MAX)
        {   mini = min( mini , ans + 1)
        }
    }
    return mini;
```
