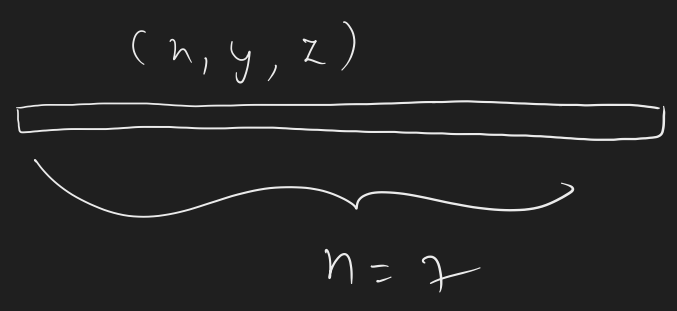
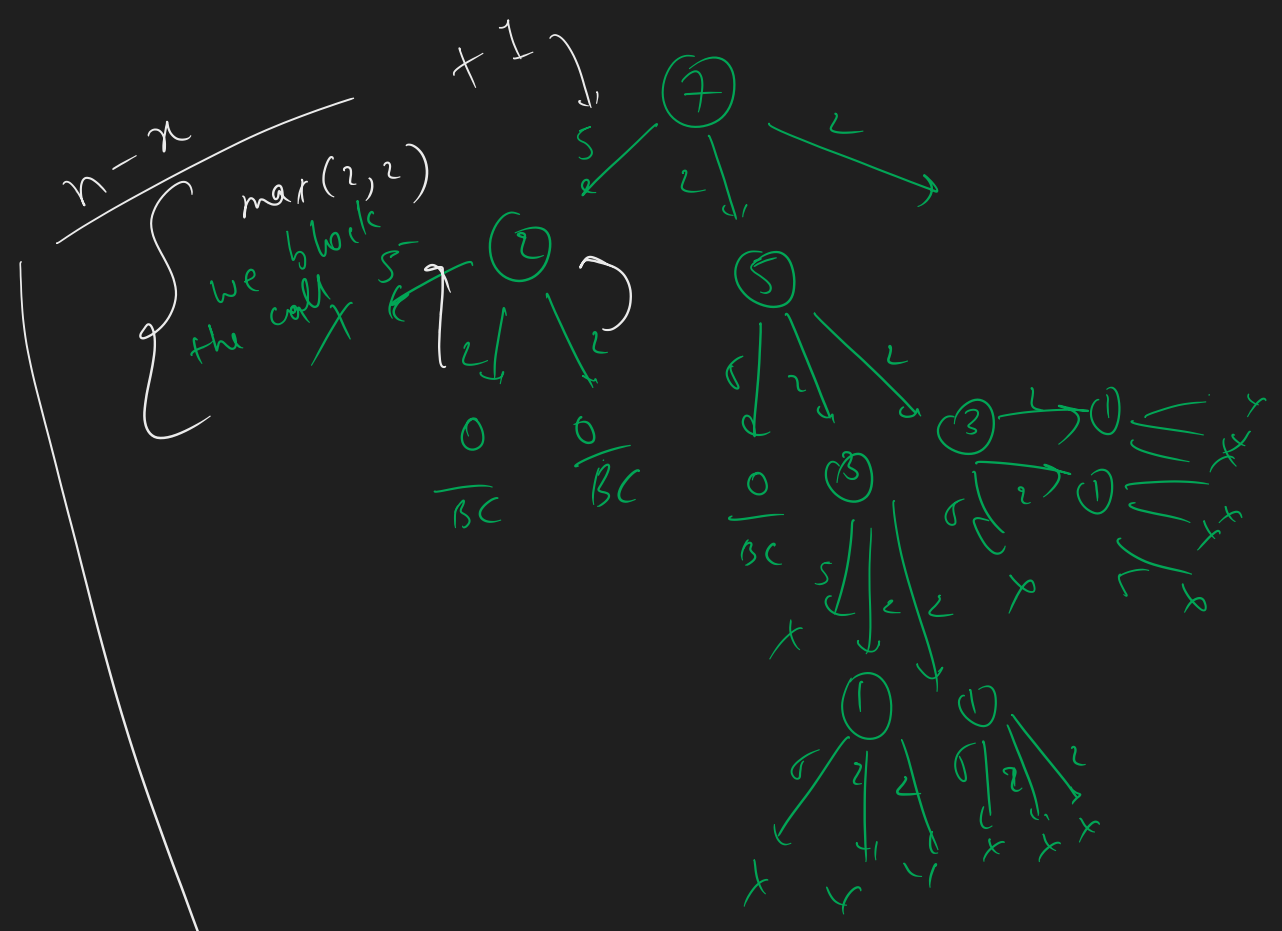
Cut into Segments :-

$n = 7$
$x = 5$
$y = 2$
$z = 2$



find Max no. of segments.

$7 = 5$ left $\Rightarrow 2$
2 left $\Rightarrow 2$ } 2 segments.



BC $\Rightarrow$ if (length of rod == 0)
{ return 0;
}
if (n < 0) return INT-MIND - we length rod

Put a = fun(n-x, x, y, z) + 1
ans of n-x
1 cut is mining no

we call for
n-x so, a = n-x length

(same case as saw in
min. no. req. to reach target sum)

Put b =
Put c =

return max(a, max(b, c));
